

## Floor Coatings

## New Developments

November 2020

The following products have been specially formulated to be effective foam control agents in floor coatings. These products display high efficacy across various applications (primer/self-leveller/topcoat), resins (epoxy/polyurethane/polyaspartic ester) and technologies (water borne/solvent free and solvent borne).

### DISPELAIR® CF 88 and CF 99

Blend of polymers in solvent. CF 88 and CF 99 are recommended for various solvent-based and solvent-free 2K systems. CF 88 and CF 99 display excellent air release in solvent-free epoxy self-levelling formulations. CF 88 and CF 99 show excellent compatibility in both pigmented and clear topcoats, as well as displaying no detrimental effect on gloss.

### DISPELAIR® CF 407

Emulsion of modified silicones. CF 407 is designed to eliminate air in the production and application of water-based polyurethane systems. CF 407 displays excellent compatibility and efficacy particularly in topcoats applied by brush/roller. CF 407 can also be used for polyurethane self-levelling formulations, as well as water-based epoxy systems.

### DISPELAIR® CF 22

Blend of polymers. CF 22 is specifically designed to work in solvent-free, 2K flooring systems. CF 22 is particularly effective at eliminating air in 100% solids polyaspartic ester systems. CF 22 can be used in either topcoat or self-leveller applications. CF 22 can also be used for solvent-based 2K systems.
